TRTT – fact sheet

What it is. TRTT is a statistics app built so that SPSS users can switch to it without relearning anything. In the browser its interface is nearly identical to SPSS Statistics 32: Data View and Variable View, the same Analyze, Graphs and Transform menus, dialog boxes with the same layout and options, and the same output tables. On iPhone and iPad the menus, options and output tables are the same, with dialogs redesigned for touch. The web version is free at https://trtt.app.

Who makes it. Rafał Rybnik, an independent developer. TRTT is not affiliated with IBM.

Who it is for. Students whose statistics course is taught in SPSS, researchers who receive survey data as .sav files, and lecturers who need a tool students can open without installing anything.

Short description (about 50 words)

TRTT is a statistics app with an interface nearly identical to SPSS, so SPSS users can switch without relearning anything. It opens .sav files, runs SPSS syntax and the analyses taught in research methods courses. The web version is free and needs no install or account; a native app runs on iPhone and iPad.

Availability and price

- **Web:** https://trtt.app – free, no paid plan, no account. Runs in a modern desktop browser.
- **iPhone and iPad:** https://apps.apple.com/app/id6792289585 – free download. Every analysis works on datasets of up to 100 cases; the optional TRTT Pro in-app purchase (weekly, monthly or lifetime) removes the limit.
- **Versions:** 1.0 on 21 July 2026, freemium model from 1.2.0 (20 August 2026), current iOS release 1.3.0 (5 October 2026).

Features

- **Data files:** opens and saves SPSS .sav files with value labels, missing values and weights (web also .zsav); imports CSV and Excel.
- **Analyses:** frequencies, descriptives, explore, crosstabs with chi-square, t-tests, ANOVA, correlations, linear and ordinal regression, factor analysis, cluster analysis, reliability (Cronbach's alpha) and nonparametric tests, with Select Cases, Split File and weighting.
- **Syntax:** a syntax editor runs SPSS-style commands and opens and saves .sps files. Every dialog can paste its command as SPSS syntax or as equivalent R and Python code.
- **Charts:** Chart Builder with bar, line, area, histogram, scatter and dual-axis charts, with panels by rows and columns.
- **Output:** exportable as SPSS Viewer (.spv); on iOS also as PDF.

Under the hood

- **One engine everywhere.** The statistics engine is written in Rust. In the browser it runs as WebAssembly; on iOS it is linked natively behind a SwiftUI interface. The same file gives the same numbers on every platform.
- **Checked against SPSS and PSPP.** 266 automated tests compare TRTT's results with output from SPSS Statistics 32 and PSPP across 22 procedures.
- **Data stays on the device.** Files are processed locally and never uploaded. The iOS app sends no telemetry and carries the App Store label "Data Not Collected". The web app sends only anonymous, aggregate feature counters, with no IP addresses, cookies or identifiers.
